

?? Breaking the Migration Lockge

The "Another process is migrating" error occurs when the dashboard service is interrupted while recreating its internal indices. Follow these steps **in exact order** to clear the lock.

1

Stop the Dashboard Service

You must stop the service to ensure no active processes are attempting to write to the index during the cleanup.

```
sudo systemctl stop wazuh-dashboard
```

2

Clear the Stuck System Index

This removes the "half-finished" index that is causing the `resource_already_exists_exception` and migration lock.

```
curl -k -u admin:'<password>' -X DELETE https://localhost:9200/.kibana*
```

Start and Allow Initialization

Restart the service. The dashboard will now see that the index is missing and recreate it cleanly.

```
sudo systemctl start wazuh-dashboard
```

The "5-Minute Rule"

Do not refresh your browser for 5 minutes. The dashboard is performing a heavy background migration. Interrupting this will recreate the migration lock, forcing you back to Step 1.
