

# ? Clean Dashboard Log Viewing

The default dashboard logs are dense JSON strings. Use these filtered commands to see exactly what is happening during a migration without the "noise".

1

## Filter for Migration Progress

This command hides the repetitive warnings and only shows messages related to the index migration and server status.

```
sudo journalctl -u wazuh-dashboard -f | grep -iE  
"migration|savedobjects|server running"
```

2

## Pretty-Print with JQ

If you have `jq` installed, this command parses the JSON into a structured, readable format with timestamps.

```
sudo journalctl -u wazuh-dashboard -f | grep --line-buffered "{" | jq '.'
```

3

## The "Finish Line" Message

Regardless of the format, you are looking for this specific log entry. Once you see it, the migration is complete.

```
"message": "http server running at https://0.0.0.0:5601"
```

## 📦 Installing JQ

If the `jq` command is not found, install it with: `sudo apt update && sudo apt install jq -y`
